

CONTENTS OF THE NOTES.

S EEDS of Canna used for prayer-beads	3	Filaments without anthers in Curcuma, Linum, &c. and styles without stigmas in many plants, shew the advance of the works of nature towards greater perfection	7
Stems and leaves of Callitriche so matted together, as they float on the water, as to bear a person walking on them	4	Double flowers, or vegetable monsters, how produced	8, 10
The female in Collinsonia approaches first to one of the males, and then to the other	4	The calyx and lower series of petals not changed in double flowers	8
Females in Nigella and Epilobium bend towards the males for some days, and then leave them	5	Dispersion of the dust in nettles and other plants	9
The stigma or head of the female in Spartium (common broom) is produced amongst the higher set of males; but when the keel-leaf opens, the pistil suddenly twists round like a French-horn, and places the stigma amidst the lower set of males	5	Cedar and Cypress unperishable	9
The two lower males in Ballota become mature before the two higher; and, when their dust is shed, turn outwards from the female	6	Anthoxanthum gives the fragrant scent to hay	10
The plants of the class Two Powers with naked seeds are all aromatic	6	Viviparous plants: the Aphis is viviparous in summer, and oviparous in autumn	10
Of these Marum and Nepeta are delightful to cats	6	Irritability of the stamen of the plants of the class Syngenesia, or Confederate males	12
The filaments in Meadia, Borago, Cyclamen, Solanum, &c. shewn by reasoning to be the most unchangeable parts of those flowers	6	Some of the males in Lychnis, and other flowers arrive sooner at their maturity	13, 14
Rudiments of two hinder wings are seen in the class Diptera, or two-winged insects	7	Males approach the female in Gloriosa, Fritillaria, and Kalmia	14
Teats of male animals	7	Contrivances to destroy insects in Silene, Dionæa muscipula, Arum muscivorum, Dyspacus, &c.	15
E e	7	Some bell-flowers close at night; others hang the mouths downwards; others nod and turn from the wind; stamens bound down to the pistil in Amaryllis formosissima; pistil is crooked in Hemerocallis flava, yellow day-lily	17
		Thorns	

Thorns and prickles designed for the defence of the plant; tall Hollies have no prickles above the reach of cattle	18	Colours of animals serve to conceal them	38
Bird-lime from the bark of Hollies like elastic gum	19	Warm bathing retards old age	39
Adansonia the largest tree known, its dimensions	20	Male flowers of Vallisneria detach themselves from the plant, and float to the female ones	40
Bulbous roots contain the embryo flower, seen by dissecting a tulip-root	22	Air in the cells of plants, its various uses	41
Flowers of Colchicum and Hamamelis appear in autumn, and ripen their seed in the spring following	23	How Mr. Day probably lost his life in his diving-ship	42
Sunflower turns to the sun by nutation, not by gyration	24	Air-bladders of fish	42
Dispersion of seeds	24	Star-gelly is voided by Herons	43
Drosera catches flies	25	Intoxicating mushrooms	44
Of the nectary, its structure to preserve the honey from insects	26	Mushrooms grow without light, and approach to animal nature	44
Curious proboscis of the Sphinx Convoluti	26	Seeds of Tillandsia fly on long threads, like spiders on the gossamer	60
Final cause of the resemblance of some flowers to insects, as the Bee-orchis	26	Account of cotton mills	64
In some plants of the class Tetradynamia, or Four Powers, the two shorter stamens, when at maturity, rise as high as the others	27	Invention of letters, figures, crotchets	66
Ice in the caves on Teneriff, which were formerly hollowed by volcanic fires	27	Mrs. Delany's and Mrs. North's paper-gardens	69
Some parasites do not injure trees, as Tillandsia and Epidendrum	28	The horologe of Flora	70
Mosses growing on trees injure them	28	The white petals of Helleborus niger become first red, and then change into a green calyx	73
Marriages of plants necessary to be celebrated in the air	28	Berries of Menispermum intoxicate fish	75
Insects with legs on their backs	28	Effects of opium	77
Scarcity of grain in wet seasons	29	Frontispiece by Miss Crewe	79
Tartarian lamb; use of down on vegetables; air, glass, wax, and fat, are bad conductors of heat; snow does not moisten the living animals buried in it, illustrated by burning camphor in snow	30	Petals of Cistus and Oenanthe continue but a few hours	79
Of the collapse of the sensitive plant	32	Method of collecting the gum from Cistus by leathern throgs	80
Birds of passage	33	Discovery of the Bark	82
The acquired habits of plants	34	Foxglove how used in Dropsies	87
Irritability of plants increased by previous exposure to cold	35	Bishop of Marseilles, and Lord Mayor of London	88
Lichen produces the first vegetation on rocks	36	Superstitious uses of plants, the divining rod, animal magnetism	98
Plants holding water	37	Intoxication of the Pythian Priests, poison from Laurel-leaves, and from cherry-kernels	100
Madder colours the bones of young animals	38	Sleep consists in the abolition of voluntary power; nightmare explained	102
		Indian fig emits slender cords from its summit	103
		Cave of Thor in Derbyshire, and subterraneous rivers explained	104
		The capsule of the Geranium makes a hygrometer; Barley creeps out of a barn	106
		Mr.	

Mr. Edgeworth's creeping hygrometer	107	Hot embers eaten by bull-frogs	149
Flower of Fraxinella flashes on the ap- proach of a candle	110	Long filaments of grasses, the cause of bad seed-wheat	151
Essential oils narcotic, poisonous, dele- terious to insects	110	Chinese hemp grew in England above 14 feet in five months	153
Dew-drops from Mancinella blister the skin	111	Roots of snow-drop and hyacinth insipid like orchis	155
Uses of poisonous juices in the vegetable economy	111	Orchis will ripen its seeds if the new bulb be cut off	155
The fragrance of plants a part of their defence	111	Proliferous flowers	156
The sting and poison of a nettle	111	The wax on the candle-berry myrtle said to be made by insects	157
Vapour from Lobelia suffocative; un- wholesomeness of perfumed hair-powder	112	The warm springs of matlock produced by the condensation of steam raised from great depths by subterranean fires	158
Ruins of Palmira	112	Air separated from water by the attrac- tion of points to water being less than that of the particles of water to each other	160
The poison-tree of Java	115. 188	Minute division of sub-aquatic leaves	161
Tulip-roots die annually	116	Water-crests and other aquatic plants in- habit all climates	161
Hyacinth and Ranunculus roots	117	Butomus esculent; Lotus of Egypt; Nymphæa	161
Vegetable contest for air and light	121	Ocymum covered with salt every night	163
Some voluble stems turn E. S. W. and others W. S. E.	121	Salt a remote cause of scrophula, and immediate cause of sea-scurvy	163
Tops of white Bryony as grateful as asparagus	122	Coloured spatha of Arum, and blotched leaves, if they serve the purpose of a co- loured petal	167
Fermentation converts sugar into spirit, food into poison	124	Tulip-roots with a red cuticle produce red flowers	167
Fable of Prometheus applied to dram- drinkers	125	Of vegetable mules the internal parts, as those of fructification, resemble the female parent; and the external parts, the male one	168
Cyclamen buries its seeds and trifolium subterraneum	126	The same occurs in animal mules, as the common mule and the hinnus, and in sheep	168
Pits dug to receive the dead in the plague	127	The wind called Harmattan from vol- canic eruptions; some epidemic coughs or influenza have the same origin	170
Lakes of America consist of fresh water	128	Fish killed in the sea by dry summers in Asia	171
The seeds of Cassia and some others are carried from America, and thrown on the coasts of Norway and Scotland	128	Hedysarum gyrans perpetually moves its leaves like the respiration of animals	172
Of the gulf-stream	129	Plants possess a voluntary power of mo- tion	172
Wonderful change predicted in the gulph of Mexico	130	E c 2	Loud
In the flowers of Cactus grandiflorus and Cistus some of the stamens are perpe- tually bent to the pistil	146		
Nyctanthus and others are only fragrant in the night; Cucurbita lagenaria closes when the sun shines on it	147		
Tropeolum, nasturtian, emits sparks in the twilight	148		
Nectary on its calyx	149		
Phosphorescent lights in the evening	149		

Loud cracks from ice-mountains explained	173	and become sweeter	178
Muschus corallinus vegetates below the snow, where the heat is always about	40.	Female figs closed on all sides, supposed to be monsters	178
Quick growth of vegetables in northern latitudes after the solution of the snows explained	174	Basaltic columns produced by volcanoes shewn by their form	180
The Rail sleeps in the snow	174	Byffus floats on the sea in the day, and sinks in the night	180
Conferva ægagropila rolls about the bottom of lakes	175	Conferva polymorpha twice changes its colour and its form	181
Lycoperdon tuber, truffle, requires no light	176	Some seed-vessels and seeds resemble insects	182
Account of caprification	178	Individuality of flowers not destroyed by the number of males or females which they contain	182
Figs wounded with a straw, and pears and plumbs wounded by insects ripen sooner,		Trees are swarms of buds, which are individuals	182
